Help and Support

Help Desk

When you were create a USB media for PCs, notebooks and servers which were using BIOS you could use several tools to do this. Now most of the tools do not really create a USB media drive which can be used to boot and install Windows or [Windows Server](#) on a UEFI based system such a new servers and for example the Surface Pro line. But it is very simple to do this now, just follow this steps:

- The USB drive has to be formatted in FAT32
- The USB needs to be GPT and not MBR
- Copy all files from the ISO to the USB drive
