

Basic Maintenance

1. check windows updates
 - 1b. if there are any then let those run and finish before moving forward (if they need to restart to finish restart)
- 2.run TFC (temp file cleaner) after windows updates are done or there aren't any during the check
3. open CMD as an administrator run the command `dism /online /cleanup-image /restorehealth` and let that finish
 - 3b. if there any issues with running it restart if there's still a problem attempts to resolve before moving forward
4. run `sfc /scannow` in CMD as well
5. when everything has run and concluded then restart the computer then you should be finished
